06. ROS 2 Launch, Param, Bag

Lecture

ROS 2 Launch

- Launch multiple nodes
- Set arguments
- Monitor running nodes
- React on changes in the state of nodes
- Python, XML and YAML file formats

Usage

```
ros2 launch package_name file.launch
ros2 launch irob_robot dvrk_server.launch arm_typ:=PSM1
```

ROS 2 Parameters

- Configure nodes at startup or during runtime without changing the code
- Associated with individual nodes
- Consists of: key, value, descriptor
- Available data types: bool, int64, float64, string, byte[], bool[], int64[], float64[] or string[].
- Useful command: `ros2 param`

ROS 2 Bag

- Record and playback ROS topics
- Command line tool
- API for C++ and Python

```
ros2 bag record -o <file_name> <topic_name>
ros2 bag record --all
ros2 bag info <filename.bag>
ros2 bag play <filename.bag>
```

Practice

1: Launch Turtlesim Mimic

1. Create the `launch` folder inside the `ros2_course` package, where the launch files can be stored:

   ```
   cd ~/ros2_ws/src/ros2_course
   mkdir launch
   ```

2. Create the `turtlesim_mimic_launch.py` file in the new `launch` folder a with the following content:

   ```
   from launch import LaunchDescription
   from launch_ros.actions import Node

   def generate_launch_description():
       return LaunchDescription([
           Node(
               package='turtlesim',
               namespace='turtlesim1',
               executable='turtlesim_node',
               name='sim'
           ),
           Node(
               package='turtlesim',
               namespace='turtlesim2',
               executable='turtlesim_node',
               name='sim'
   ```

```
        ),
        Node(
            package='turtlesim',
            executable='mimic',
            name='mimic',
            remappings=[
                ('/input/pose', '/turtlesim1/turtle1/pose'),
                ('/output/cmd_vel', '/turtlesim2/turtle1/cmd_vel'),
            ]
        )
    ])
```

3. Add the followings to the `setup.py` file:

```
import os
from glob import glob

# ...

data_files=[
    ('share/ament_index/resource_index/packages',
        ['resource/' + package_name]),
    ('share/' + package_name, ['package.xml']),
    # Include all launch files.
    (os.path.join('share', package_name),
        glob('launch/*launch.[pxy][yma]*'))
],
```

4. Add the `ros2launch` dependency to the `package.xml` file:

```
<exec_depend>ros2launch</exec_depend>
```

5. Build the workspace:

```
cd ros2_ws
colcon build --symlink-install
```

6. Launch the launch file:

```
ros2 launch ros2_course turtlesim_mimic_launch.py
```

7. Publish to the topic from the command line, in a new terminal window:

```
ros2 topic pub -r 1 /turtlesim1/turtle1/cmd_vel geometry_msgs/msg/Twist "{linear: {x: 2.0, y: 0.0, z: 0.0}, angular: {x: 0.0, y: 0.0, z: -1.8}}"
```

8. Let's examine the operation of the system using `rqt_gui`:

```
ros2 run rqt_gui rqt_gui
```

2: Launch Turtlesim Goto

1. Let's make a copy of `turtlesim_mimic_launch.py` from a file named `turtlesim_controller_launch.py`.

2. Add the `turtlesim_controller` node written in the previous lesson to the launch file, so the first turtle is controlled by this node, and the second copies its movement. The turtle to be controlled can be set using `namespace` or `remappings`.

3. Build the workspace:

```
cd ros2_ws
colcon build --symlink-install
```

4. launch the new launch file:

```
ros2 launch ros2_course turtlesim_controller_launch.py
```

3: Turtlesim controller params

1. Modify `turtlesim_controller` so that the linear velocity and angular velocity. is adjustable via ROS parameters. API example for parameters:

```
import rclpy
import rclpy.node

class MinimalParam(rclpy.node.Node):
    def __init__(self):
        super().__init__('minimal_param_node')
        # Declare parameter named 'my_parameter' and
        # set default value to 'world'
        self.declare_parameter('my_parameter', 'world')
        self.timer = self.create_timer(1, self.timer_callback)

    def timer_callback(self):
        my_param =
self.get_parameter('my_parameter').get_parameter_value().string_value
        self.get_logger().info('Hello %s!' % my_param)

def main():
    rclpy.init()
    node = MinimalParam()
    rclpy.spin(node)

if __name__ == '__main__':
    main()
```

2. Let's run `turtlesim_controller.py` using the previously written launch file. Let's list the parameters.

```
ros2 launch ros2_course turtlesim_controller_launch.py
```

```
ros2 param list
```

3. Change the speed and angular velocity parameters from the command line using the following command:

```
ros2 param set <NODE_NAME> <PARAM_NAME> <NEW_VALUE>
ros2 param set controller speed 100.0
```

Bonus 1: Turtlesim controller launch and substitutions

1. Let's make a copy of `turtlesim_controller_launch.py` as `turtlesim_controller_param_launch.py`. Modify the new launch file based on the

example below so that the velocity and angular velocity parameters of the launch can be specified as file arguments.

```
from launch_ros.actions import Node
from launch import LaunchDescription
from launch.actions import DeclareLaunchArgument, ExecuteProcess, TimerAction
from launch.conditions import IfCondition
from launch.substitutions import LaunchConfiguration, PythonExpression

def generate_launch_description():

    turtlesim_ns_launch_arg = DeclareLaunchArgument(
        'turtlesim_ns',
        default_value='turtlesim1',
        description='Namespace for turtle 1'
    )
    use_provided_red_launch_arg = DeclareLaunchArgument(
        'use_provided_red',
        default_value='False'
    )
    new_background_r_launch_arg = DeclareLaunchArgument(
        'new_background_r',
        default_value='200'
    )
    background_g_launch_arg = DeclareLaunchArgument(
        'background_g',
        default_value='100'
    )
    background_b_launch_arg = DeclareLaunchArgument(
        'background_b',
        default_value='100'
    )

    turtlesim_ns_value = LaunchConfiguration('turtlesim_ns')
    use_provided_red_value = LaunchConfiguration('use_provided_red')
    new_background_r_value = LaunchConfiguration('new_background_r')
    background_g_value = LaunchConfiguration('background_g')
    background_b_value = LaunchConfiguration('background_b')

    turtlesim_node = Node(
        package='turtlesim',
        namespace=turtlesim_ns_value,
        executable='turtlesim_node',
        name='sim',
        parameters=[{
            'background_g': background_g_value,
            'background_b': background_b_value,
        }]
    )
    spawn_turtle = ExecuteProcess(
        cmd=[[
            'ros2 service call ',
            turtlesim_ns,
            '/spawn ',
            'turtlesim/srv/Spawn ',
            '"{x: 2, y: 2, theta: 0.2}"'
```

```
        ]],
        shell=True
    )
    change_background_r = ExecuteProcess(
        cmd=[[
            'ros2 param set ',
            turtlesim_ns,
            '/sim background_r ',
            '120'
        ]],
        shell=True
    )
    change_background_r_conditioned = ExecuteProcess(
        condition=IfCondition(
            PythonExpression([
                new_background_r_value,
                ' == 200',
                ' and ',
                use_provided_red
            ])
        ),
        cmd=[[
            'ros2 param set ',
            turtlesim_ns_value,
            '/sim background_r ',
            new_background_r
        ]],
        shell=True
    )

    return LaunchDescription([
        turtlesim_ns_launch_arg,
        use_provided_red_launch_arg,
        new_background_r_launch_arg,
        turtlesim_node,
        spawn_turtle,
        change_background_r,
        TimerAction(
            period=2.0,
            actions=[change_background_r_conditioned],
        )
    ])
```

2. Build the workspace and run `turtlesim_controller_param_launch.py`:

```
cd ros2_ws
colcon build --symlink-install
ros2 launch ros2_course turtlesim_controller_param_launch.py
```

3. Let's list the arguments of the new launch file:

```
ros2 launch ros2_course turtlesim_controller_param_launch.py --show-args
```

4. Run the launch file by setting the arguments:

```
ros2 launch ros2_course turtlesim_controller_param_launch.py speed:=100.0
omega:=60.0
```

5. Using the example above, let's set the background color also using command line argument(s).

Bonus 2: Rosbag

1. While the program implemented in the previous exercise is running, record the contents of the topics in a rosbag file.

```
ros2 bag record --all
```

> **Syntax**
>
> The filename and the topics to record can also be set, e.g.:

```
ros2 bag record -o turtle_bagfile_1 /turtle1/cmd_vel /turtle1/pose
```

2. Use the following command to query the properties of the bag file:

```
ros2 bag info <PATH_TO_BAGFILE>
```

3. Play back the bag file and plot the `pose/x` value of one of the turtles on a graph using `rqt_gui`.

```
ros2 bag info <PATH_TO_BAGFILE>
```

```
ros2 run rqt_gui rqt_gui
```
