Projects

Challenge levels and grades

Projects can be completed at three *Challenge levels*. The *Challenge level* determines the **best** grade that can be received to the project!

Challenge level	Best grade	
Basic	3	
Advanced	4	
Epic	5	

Tip

The projects are defined in a way that it is recommended to tart with the Basic level, and then gradually work towards Epic.

The projects are graded based on the follwoing aspects:

- Proved to be the student's own work
- Running results valid output
- Usage of versioning, usage of GitHub/GitLab/other repository
- Grading:
 - completeness of the soultion
 - proper ROS communication
 - proper structure of the program
 - quality of implementation
 - · documentation quality

Grading

Personal attendance on the classes is mandatory (min 70%).

To pass the course, Tests and the Project must be passed (grade 2). One of the Test can be taken again.

 $(Jegy = (Test1 + Test2 + 2 \land Project) / 4)$

Project topics

1. Mobil robot

A. Playground Robot

- Gazebo install
- Setting up a robot simulation (Gazebo)

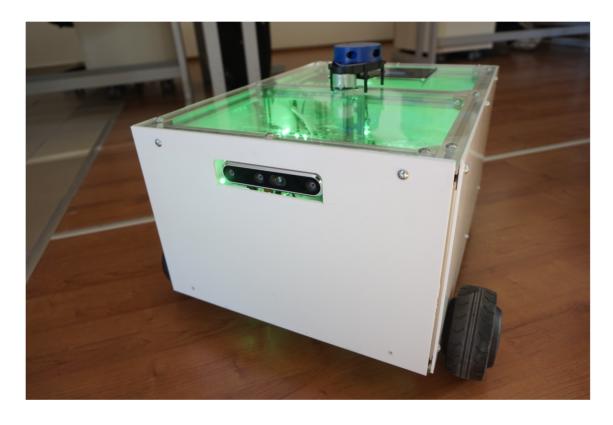

B. TurtleBot4

- TurtleBot4 Simulator Tutorial
- TurtleBot4 GUI Docs

C. PlatypOUs (ROS 1)

• PlatypOUs GitHub

D. Any mobile robot

1.1. Mobile robot obstacle avoidance

- **Basic:** SSimulator setup, testing SLAM. Implementation of ROS node(s) to read the sensor data and move the robot.
- Advanced: Implementation of a ROS system to detect obstacle. Calculation
 and execution of a trajectory avoiding the obstacle in the simulator, using any
 sensor of the robot.
- **Epic:** Implementation and testing on the real robot/impress me!

1.2. Mobile robot path following

- **Basic:** Simulator setup. Implementation of ROS node(s) to read the sensor data and move the robot.
- **Advanced:** Implementation of a ROS system for path following in the simulator, using any sensor of the robot (e.g., driving next to the wall with given distance using LIDAR).
- **Epic:** Implementation and testing on the real robot/impress me!

1.3. Mobile robot object follwoing

- **Basic:** Simulator setup. Implementation of ROS node(s) to read the sensor data and move the robot.
- Advanced: Implementation of a ROS system to detect an object and follow it in the simulator, using any sensor of the robot(e.g., visual servoing).
- **Epic:** Implementation and testing on the real robot/impress me!

1.4. Mobile robot action library

- **Basic:** Simulator setup. Implementation of ROS node(s) to read the sensor data and move the robot.
- Advanced: Implementation of a ROS action library containing simple actions and their execution (e.g., push object, move to object, turn around).
- **Epic:** Implementation and testing on the real robot/impress me!

2. Quadcopter

- Gazebo install
- Setting up a robot simulation (Gazebo)

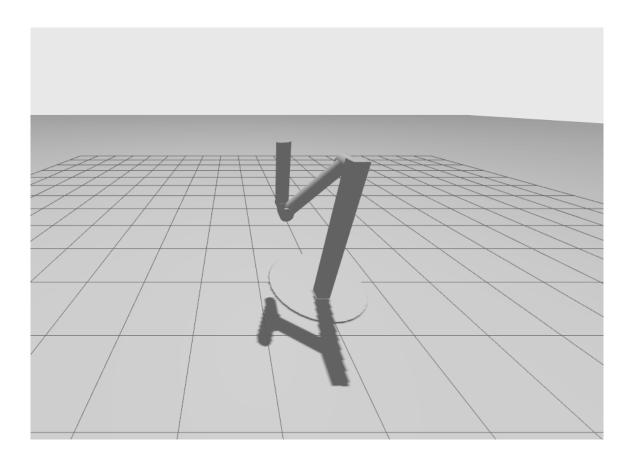

ign gazebo -v4-r quadcopter.sdf

- **Basic:** Simulator setup. Implementation of ROS node(s) to read the sensor data and move the robot.
- Advanced: ROS system implementation to control velocity/position.
- Epic: Impress me!

3. Any Gazebo simulaion

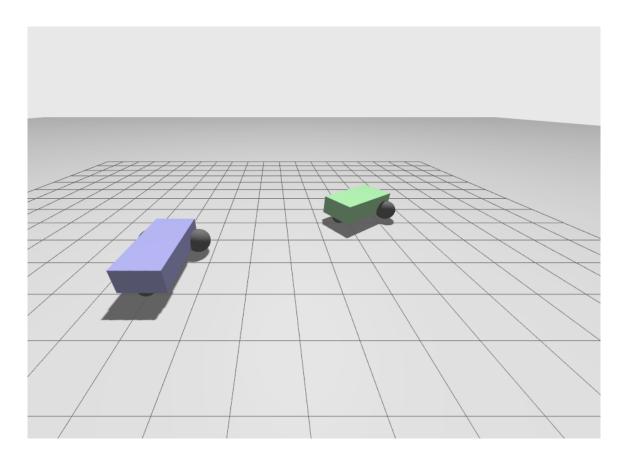

- Gazebo install
- Setting up a robot simulation (Gazebo)
- Gazebo World Examples

Based on discussion.

4. Gazebo simulation creation

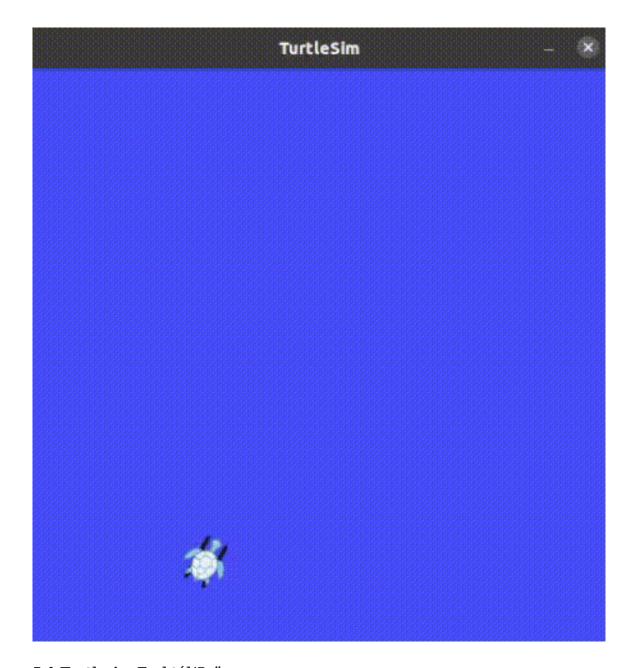

- Gazebo install
- Setting up a robot simulation (Gazebo)
- Gazebo World Examples

Based on discussion.

5. TurtleSim

- Turtlesim Tutorial
- Koch snowflake

5.1 Turtlesim Fraktál/Szöveg

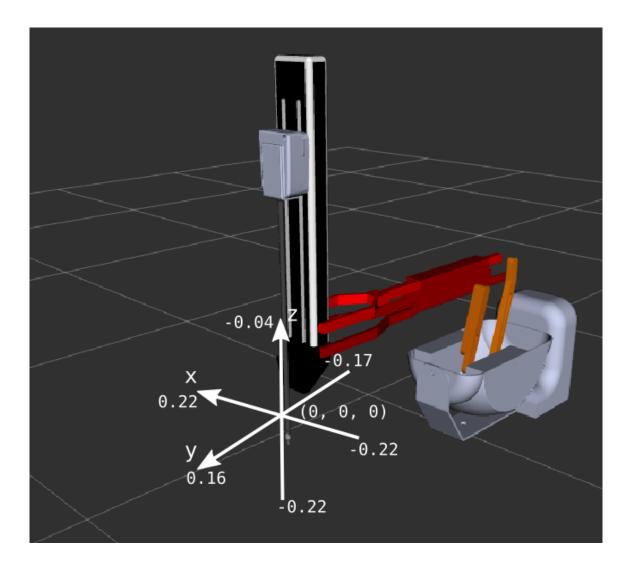

• Basic: Implement a proportianl controller.

• Advanced: Draw fractal/text.

• Epic: Impress me!

6. DVRK

- Download and compile dVRK 2
- Marker examples

6.1 DVRK Interactive Marker

Graspable, movable marker for the DVRK simulator.

7. YouBot (Windows)

• YouBot controller GitHub

7.1. YouBot ROS integration

- Basic: YouBot repo build.
- **Advanced:** ROS wrapper/interface implementation, move the simulated arm in joint space from ROS.
- **Epic:** Implementation and testing on the real robot/impress me!

X. Custom topic

Based on discussion.
